

ABSTRACT OF THE DISCLOSURE

A digital video receiver and a data stream creating method thereof. The digital video receiver receives and decodes a broadcasting program, creates a predetermined type of data stream and transmits the data stream to a recording/reproducing apparatus which is connected thereto through an interface. The digital video receiver includes a program information converter which converts the program information included in the broadcasting program into a format suitable for the recording/reproducing apparatus connected thereto through the interface, and a stream generator which receives the converted program information and decoded broadcasting data to generate a data stream with the received information and data. Accordingly, program information can always be added to the broadcasting program before transmission even when the received program is in a format different from the transmission format for the recording/reproducing apparatus.
